**Reg. No: 12105798**

**Roll No: RK2CHB64**

Under the Guidance of  
**(WASEEM UD DIN WANI)**

*School of Computer Science and Engineering*

# DECLARATION

We here by declare that the project work entitled(“**T20 World Cup Data Analysis & Premier League Matches Prediction**”) is an authentic record of our own work carried out as requirements of Capstone Project for the award of B. Tech degree in Python Project from Lovely Professional University, Phagwara, under the guidance of Waseem Ud Din Wani , during January to May 2023. All the information furnished in this capstone project report is based on our own intensive work and is genuine.

Name of Student: Utkrist Ark

Registration Number: 12105798

# CERTIFICATE

This is to certify that the declaration statement made by this group of students is correct to the best of my knowledge

and belief. They have completed this Capstone Project under my guidance and supervision. The present work is the result of their original investigation, effort, and study. No part of the work has ever been submitted for any other degree at any University. The Capstone Project is fit for the submission and partial fulfilment of the conditions for the award of B.Tech degree in from Lovely Professional University, Phagwara.

**Signature and Name of the Mentor**

**Designation**

**School of Computer Science and Engineering, Lovely Professional University, Phagwara, Punjab.**

## ABSTRACT

This cricket data analysis project aims to analyze recently held t20 Cricket worldcup (held in Oman and the United Arab Emirates) data from the internet by leveraging web scraping, Python, pandas, and

Power BI. The project will involve scraping relevant data from ESPNcricinfo storing the scraped data in a structured format using pandas, and analyzing the data.

## INTRODUCTION

Cricket is a widely popular sport across the world, with millions of fans, players, and stakeholders. With the advent of technology, it is now possible to access a vast amount of cricket-related data from the internet. This has led to the emergence of data analysis and visualization techniques that can be applied to gain insights into the game.

Some of the key metrics that will be analyzed include team and player statistics, match results, player performance, and rankings. The project will also explore trends and patterns in the data to gain insights into the game and make predictions for future matches.

## OBJECTIVE

The primary objective of this cricket data analysis project is to leverage web scraping, Python, pandas, and Power BI to analyze historical cricket data from various online sources. The project aims to achieve the following objectives:

- 1.To collect and store relevant cricket data from various online sources using web scraping techniques.
- 2.To structure the collected data and store it in a usable format using Python and pandas.
- 3.To perform various data manipulation techniques such as filtering, grouping, and pivoting to analyze the collected data.
- 4.To gain insights into the game of cricket by analyzing key metrics such as team and player statistics, match results, player performance, and rankings.
- 5.To explore trends and patterns in the data and make predictions for future matches.
- 6.To visualize the analyzed data using Power BI and create interactive visualizations such as charts, graphs, and dashboards.
- 7.To provide a comprehensive and user-friendly interface to explore the data, uncover hidden insights, and make informed decisions.

## DESCRIPTION

The Cricket data analysis project using web scraping, python, pandas, and power bi is a project that involves the analysis of historical cricket data from online sources to gain insights into the game. The project leverages web scraping techniques to collect relevant data sources like ESPNcricinfo. The collected data is then

stored in a structured format using the Python programming language and the pandas library.

The project involves various data manipulation techniques, such as filtering, grouping, and pivoting, to analyze the collected data. Key metrics such as team and player statistics, match results, player performance, and rankings are analyzed to gain insights into the game of cricket. The project also explores trends and patterns in the data to make predictions for future matches.

The final output of the project is visualized using Power BI, which provides a user-friendly interface to explore the data, uncover hidden insights, and make informed decisions. The visualization includes interactive visualizations such as charts, graphs, and dashboards.

The insights generated from this project can be useful for cricket enthusiasts, analysts, and stakeholders in the cricketing world, providing valuable insights and understanding of the game. Overall, the Cricket data analysis project using web scraping, python, pandas, and power bi is an essential project that leverages the power of data analysis and visualization techniques to gain insights into the game of cricket.

## CODE

```
import pandas as pd
import json
with open('t20_json_files/t20_json_files/t20_wc_match_results.json') as f:
    data = json.load(f)
```

```
df_match = pd.DataFrame(data[0]['matchSummary'])
df_match.head()
df_match.shape
(45, 7)
```

### Use scorecard as a match id to link with other tables

```
df_match.rename({'scorecard': 'match_id'}, axis =
1, inplace = True)
df_match.head()
```

### Create a match ids dictionary that maps team names to a unique match id. This will be useful later on to link with other tables

```
match_ids_dict = {}
```

```
for index, row in df_match.iterrows():
    key1 = row['team1'] + ' Vs ' + row['team2']
```

```
key2 = row['team2'] + ' Vs ' + row['team1']
match_ids_dict[key1] = row['match_id']
match_ids_dict[key2] = row['match_id']

df_match.to_csv('t20_csv_files/dim_match_summary.
csv', index = False)

with open('t20_json_files/t20_json_files/t20_wc_b
atting_summary.json') as f:
    data = json.load(f)

SENSEX Market Brief

## SCOPE OF PROJECT

The scope of the Cricket data analysis project using web scraping, python, pandas, and power bi is vast, and it can cover multiple areas of cricket analysis. The primary focus of the project is to collect historical cricket data from various online sources using web scraping techniques and analyze it to gain insights into the game.

The scope of the project includes the analysis of various metrics such as team and player statistics, match results, player performance, and rankings. The project can also explore trends and patterns in the data to make predictions for future matches.

The project can be used to analyze data for various formats of cricket, including test matches, one-day internationals, and T20s. It can cover data for both international and domestic cricket matches and can be customized to suit the requirements of different stakeholders in the cricketing world. The project can also be extended to include analysis of social media data to gain insights into public sentiment around cricket matches and players. The scope can further be expanded to track player movements and analyze their performance on the field using data from sensors and cameras placed on the field.

Overall, the scope of the Cricket data analysis project using web scraping, python, pandas, and power bi is broad, and it has the potential to provide valuable insights into the game of cricket. The project can be customized to suit different requirements and can be extended to cover new areas of cricket analysis in the future

## FUTURE DEVELOPMENT OF THE PROJECT

The Cricket data analysis project using web scraping, python, pandas, and power bi has a lot of potential for future development. Some of the possible future development areas for this project include:

**Real-time Data Analysis:** One of the future development areas for the project is to incorporate real-time data analysis to provide up-to-date insights into ongoing matches. This will require the project to collect live data and analyze it in real-time.

**Machine Learning:** Another future development area for the project is to incorporate machine learning techniques to enhance the accuracy of predictions and insights generated from the data. This will require the use of advanced algorithms such as neural networks and decision trees.

**Social Media Analysis:** The project can also be extended to include analysis of social media data to gain insights into public sentiment around cricket matches and players.

**Player Tracking:** The project can also be extended to track player movements and analyze their performance on the field. This can be done using data from sensors and cameras placed on the field.

**Mobile Application:** The project can also be developed into a mobile application that provides live updates, insights, and predictions on ongoing matches.

Overall, there are numerous possibilities for future development of the Cricket data analysis project using web scraping, python, pandas, and power bi. These developments will enhance the accuracy and usefulness of insights generated from the project and provide more value to cricket enthusiasts, analysts, and stakeholders in the cricketing world.

## CONCLUSION

The Cricket data analysis project using web scraping, python, pandas, and power bi is a comprehensive project that leverages various techniques to analyze historical cricket data from multiple online sources. The project aims to gain insights into the game of cricket and explore trends and patterns in the data.

By leveraging web scraping techniques, relevant data is collected and stored in a structured format using Python and pandas. The project involves various data manipulation techniques, such as filtering, grouping, and pivoting, to analyze the collected data. Key metrics such as team and player statistics, match results, player performance, and rankings are analyzed to gain insights into the game. The final output of the project is visualized using Power BI, which provides a user-friendly interface to explore the data and create interactive visualizations such as charts, graphs, and dashboards. The insights generated from this project can be useful for cricket enthusiasts, analysts, and stakeholders in the cricketing world, providing valuable insights and understanding of the game. The project demonstrates the power of data analysis and

visualization techniques in gaining insights into complex datasets and making informed decisions.

Overall, the Cricket data analysis project using web scraping, python, pandas, and power bi is an essential project that showcases the potential of technology in the field of sports analysis and provides valuable insights into the game of cricket..
